

Paper 095 — Form-FORCED / Value-INHERITED Methodology

Allen Proxmire

May 2026

Preamble — What This Paper Does NOT Claim

1. This paper does **not** claim novel substantive content beyond formalizing the corpus’s methodological discipline.
2. It does **not** override any constituent-paper verdict.
3. It does **not** introduce new substrate primitives.
4. “Form-FORCED / value-INHERITED methodology” = the corpus’s consistent rule: structural form of results is FORCED by substrate primitives + declared postulates; numerical values, coefficients, and matching parameters are INHERITED from empirical / standard-physics literature.

Abstract

The ED corpus employs a consistent **form-FORCED / value-INHERITED** methodology: across QM-emergence (Phase-1), QFT-arc, gravity arc, BH arc, Q-Compute arc, entanglement arc, soft-matter arc, and wedges arc, structural forms (equations, inequalities, classifications, scaling laws) are FORCED by substrate primitives + declared postulates; numerical values, coefficients, and matching parameters are INHERITED. This paper formalizes the methodology, supplies a verdict-classification grammar (FORCED-unconditional / Intermediate Path C / form-FORCED + value-INHERITED), and identifies the methodology’s structural strengths and limits.

1 Primitive Inputs and Paper-Specific Postulates

1.1 Primitives invoked (per Paper_087)

This is a methodology paper; primitives are invoked only at the meta-level. The 13 primitives P01–P13 are the substrate-level content; methodology is what the corpus does with them.

1.2 Upstream dependencies

- **I-087:** Paper_087 13-primitive position paper.
- **I-088:** Paper_088 primitive load-bearing audit.
- **I-089:** Paper_089 V1 canonical reference (exemplar of methodology applied).

1.3 Paper-specific postulates

- **P-Methodology-Triple:** The corpus methodology classifies all results into one of three verdict-tiers:
 - **(M1) FORCED-unconditional:** result follows from the 13 primitives + standard math, no additional paper-specific postulates required.

- (M2) **Intermediate Path C**: result follows from primitives + standard math + a small number of declared paper-specific postulates whose constructive derivation is OPEN.
- (M3) **form-FORCED + value-INHERITED**: structural form follows under primitives + postulates; numerical values inherited via empirical matching.
- **P-Methodology-Consistency**: All Wave-2 papers across the corpus apply this methodology consistently.

§2.5 Audit Table

#	Step	Label	Notes
1	13 primitives	I (axiomatic)	Paper_087.
2	Primitive load-bearing audit	I	Paper_088.
3	Three-tier verdict classification	P-Methodology-Triple	Postulate.
4	Cross-corpus consistent application	P-Methodology-Consistency	Postulate.
5	Specific verdict assignments	I	Per-paper inheritance.

2 The Methodology

2.1 Three verdict tiers

- (M1) **FORCED-unconditional**. Example: Phase-1 QM emergence (four QM postulates forced from primitives + standard math; no additional postulates declared at the QM-postulate level).
- (M2) **Intermediate Path C**. Example: NS-smoothness (Paper_077), YM Clay-relevance (Paper_023), Arc ED-10 (Paper_033), NS-MHD H1/H2/H3 closure (Paper_081). Substrate mechanisms identified; postulates declared; constructive derivations OPEN.
- (M3) **form-FORCED + value-INHERITED**. Example: Newton’s G (Paper_027; form FORCED, G value INHERITED), BTFR slope-4 (Paper_031), area-law (Paper_043), Krieger–Dougherty rheology (Paper_079).

2.2 Honest labels

The methodology requires every load-bearing step in every paper to be labeled:

- **P** (postulate / definition).
- **A** (analogy / regime / position).
- **I** (inherited / empirical / standard math).
- **D** (actual derivation).
- **D-via-I** (application of standard machinery to substrate-adapted content under declared postulates).
- **OPEN** (not claimed; flagged for future work).

2.3 No conflation

Standard-form constructions (e.g., writing down the Klein-Gordon equation, the Lindblad form, the MOND-like field equation, the tensor product $\Psi^A \otimes \Psi^B$) are **P (definitional)**, not **D**. Empirically matched parameters are **I**, not **D**. Composite verdicts assembled from upstream inheritances are **D** (the composition itself is new content) or **A→position** (when the verdict is a framing claim).

2.4 Methodological strengths

- **Falsifiability:** every postulate has a stated F-line.
- **Honest cumulativity:** future derivations strengthen by reducing P-postulates to D-rows.
- **No overclaim:** numerical values are not claimed as derived unless they are.

2.5 Methodological limits

- Many corpus results are at **(M3)** level: form derived, values not. This is a strength relative to “derive everything” overclaims but a limit relative to constructive-QFT or constructive-relativity ambitions.
- The methodology does not produce constructive proofs of Clay-class problems; it produces Intermediate Path C verdicts (M2).

3 Falsification Criteria

- **F1:** Discovery of a corpus paper where load-bearing steps are unlabeled or mislabeled at scale — refutes P-Methodology-Consistency.
- **F2:** Identification of a verdict that does not fit any of the three tiers (M1, M2, M3) — refutes P-Methodology-Triple’s exhaustiveness.
- **F3:** Discovery of a corpus result claimed as D but actually I, P, or A on rereading — falsifies the specific paper’s discipline.

4 Position Statement

The ED corpus employs a **form-FORCED / value-INHERITED methodology** with three-tier verdict classification (M1 / M2 / M3) under P-Methodology-Triple + P-Methodology-Consistency. The methodology is **the academic case**: cross-domain reach + honest labels.
